

THE STRENGTH WEEK

One complete training week. Three sessions of 45 minutes. Built for a woman with a full-time job who has trained for years and still can't see it.

Start it on Monday.

By Sunday you will know the difference.

WHAT'S INSIDE

The 3 mistakes that keep strong women stuck

3 full gym sessions, exercise by exercise

How to turn one week into eight

A one-page training log

Read this first

You did not get this because you are lazy. You got it because you are doing a lot and getting very little back for it.

Most women who land here have been training for years. They show up. They sweat. They finish sessions that feel hard. And then they look in the mirror in January and see the same body they saw last January.

That is almost never a discipline problem. It is a structure problem. The work is going in; it just is not pointing anywhere.

WHAT THIS WEEK IS

One real training week from the way I program for my clients. Three sessions, 45 minutes each, in a normal gym, next to a normal job. Nothing has been watered down for a free download.

WHAT THIS WEEK IS NOT

It is not a full program. One week shows you what the method feels like. It cannot rebuild a body — that takes eight weeks minimum of planned progression. Page 07 tells you exactly where to go next.

HOW TO USE IT

01

Pick your three days.

Any three days with at least one rest day between two of them. Mon / Wed / Fri and Tue / Thu / Sat both work.

02

Do the sessions in order.

Session A, then B, then C. They are built to balance each other, not to be shuffled.

03

Write down every set.

Weight and reps. Every single one. Page 08 is for this. This is the part almost everyone skips and it is the part that makes the next seven weeks work.

Why it never showed

Three mistakes. Not one of them is about effort. That is exactly why they are so hard to spot from the inside.

01

You chase variety instead of repetition

A new workout every week feels productive. It is the single fastest way to make sure nothing ever improves.

Your body does not change because a session was creative. It changes because a specific movement got measurably harder over time. If you squat 40 kg this week and something else next week, there is no line to draw. Progress needs a fixed set of lifts repeated long enough to load them.

THE FIX Keep the same core lifts for at least six to eight weeks. Change the numbers, not the exercises.

02

You measure the session by how wrecked you feel

Sweat, burn and soreness are sensations. They are not signals that anything got stronger.

It is entirely possible to finish a session soaked, out of breath and sore — and to have applied less useful tension than someone who did four calm, heavy sets. Fatigue is easy to create and tells you almost nothing. Load and reps tell you everything.

THE FIX Judge a session by one question: did anything go up compared to last time? More weight, more reps, or cleaner technique at the same weight.

03

You do five average sessions instead of three good ones

More days in the gym is the most expensive way to get less out of it.

Five sessions next to a job, a commute and a life means five sessions you arrive at tired and leave early. Three sessions you can actually recover from will beat five you cannot, every time. Muscle is built between sessions, not during them — and recovery is not optional, it is the mechanism.

THE FIX Three quality sessions per week, fully recovered, fully logged. Walk on the other days. That is enough to change a body.

Before you start

WARM-UP (EVERY SESSION)

5 minutes. 3 min easy bike or rower, then 10 bodyweight squats, 10 hip bridges, 10 band pull-aparts. That is the whole warm-up.

REST

Rest exactly as written. Ninety seconds feels long when you are used to circuits. It is what lets you lift something worth lifting on the next set.

REPS IN RESERVE

"RPE 8" means you could have done roughly two more reps. Aim there on every working set.

HOW HEAVY?

Pick a weight where the last two reps are genuinely hard but your technique does not fall apart. If you finish a set and could have done five more, it was too light.

SUPERSETS

Exercises sharing a letter (C1 / C2) are done back to back with no rest between them. Rest after the pair, then repeat.

IF SOMETHING HURTS

Sharp pain is a stop signal, not something to push through. Swap the movement or leave it out and speak to a professional.

SESSION A

Lower Body — Glutes & Hamstrings

POSTERIOR CHAIN

45 minutes | incl. 5 min warm-up

This is the session that changes your shape the most, so it goes first in the week while you are freshest.

EXERCISE	SETS	REPS	REST	RPE
WARM-UP				
5 min: bike or rower, then 10 bodyweight squats, 10 hip bridges, 10 band pull-aparts				
MAIN WORK				
A Barbell Hip Thrust Chin tucked, ribs down. Squeeze hard for one second at the top of every rep.	4	8	90 sec	8
B Romanian Deadlift Bar stays close to the legs. Stop when you feel the hamstrings, not when you reach the floor.	3	10	90 sec	8
C1 Walking Lunge (dumbbells) Long step. Back knee travels down, not forward.	3	10 / leg	—	8
C2 Seated Leg Curl Slow on the way back — three seconds.	3	12	60 sec	8
D1 Cable Kickback or Hip Abduction Light. This is about feeling the glute working, not about the number on the stack.	3	15 / side	—	8
D2 Dead Bug Lower back stays flat on the floor the entire set.	3	8 / side	60 sec	—

COACH'S NOTE

If you only ever remember one thing from this page: the hip thrust weight should go up almost every week for the first two months. Write down what you used today — you will need it on Monday.

SESSION B

Upper Body — Push & Pull

BACK, CHEST & SHOULDERS

45 minutes | incl. 5 min warm-up

Most women under-train their back and then wonder why their posture and waistline never change. This session fixes that.

EXERCISE	SETS	REPS	REST	RPE
WARM-UP				
5 min: rower or incline walk, then 10 band pull-aparts, 10 scapular pulls, 10 push-ups on a bench				
MAIN WORK				
A Lat Pulldown or Assisted Pull-up Pull with the elbows, not the hands. Chest stays proud.	4	8–10	90 sec	8
B Dumbbell Bench Press Slight incline is fine. Elbows around 45 degrees from the body.	3	10	90 sec	8
C1 Seated Cable Row Two-second pause with the handle at the ribs.	3	12	—	8
C2 Dumbbell Shoulder Press Seated with back support if your lower back likes to help out.	3	10	75 sec	8
D1 Face Pull High elbows. This is the single best five minutes you can spend on posture.	3	15	—	7
D2 Hollow Hold Bend the knees to make it easier before you shorten the time.	3	20–30 sec	60 sec	—

COACH'S NOTE

Upper body strength moves slower than lower body — that is normal, not a sign it is not working. One extra rep on the pulldown is a good week.

SESSION C

Full Body — Strength & Carry

SQUAT, ROW & LOADED CARRY

45 minutes | incl. 5 min warm-up

Squat, pull, push, carry. This is the session that makes everyday life feel lighter, not just the gym.

EXERCISE	SETS	REPS	REST	RPE
WARM-UP				
5 min: bike, then 10 bodyweight squats, 10 hip bridges, 10 band pull-aparts				
MAIN WORK				
A Barbell Back Squat or Goblet Squat Go as deep as you can with a neutral spine. Depth beats weight, every time.	4	6–8	2 min	8
B Single-Arm Dumbbell Row Hips square to the floor. No twisting to move a heavier bell.	3	10 / side	90 sec	8
C1 Dumbbell or Machine Hip Thrust Lighter than Session A. Full squeeze at the top.	3	12	—	8
C2 Push-up (feet or bench) Stop two reps short of failure. Body moves as one line. Use a bench if floor push-ups run out fast.	3	8–12	75 sec	8
D Farmer's Carry Heavy. Shoulders down, ribs stacked over hips, walk tall.	4	40 m	60 sec	8
E Side Plank Hips high. Breathe normally throughout.	2	30 sec / side	45 sec	—

COACH'S NOTE

The carry is not filler. Grip, core and posture all get trained at once, and it is the most honest strength test in the building. Take note of the weight — it climbs fast.

And then what?

One week proves the method works. Eight weeks changes what you see in the mirror. Here is exactly how this week becomes eight.

You do not need new workouts. You need these three, repeated, with the numbers going up. That is the whole secret, and it is the part almost nobody has the patience for.

THE RULE: DOUBLE PROGRESSION

Every exercise has a rep range. Start at the bottom of it. Add one rep per set each week until you reach the top of the range at good technique. Then add the smallest possible amount of weight, drop back to the bottom of the range, and climb again. That is it. No new exercises, no guessing.

WEEKS 1–3

Build the line

Repeat Sessions A, B and C exactly as written. Add reps where you can. Do not add weight until you hit the top of the rep range with clean form. Most of what you gain here is skill — and skill is what lets you load properly later.

WEEK 4

Pull back

Same sessions, same weights, one set fewer on everything. This is not a lost week. It is where the previous three actually catch up with you, and you will feel noticeably stronger in week 5.

WEEKS 5–8

Load it

Now the weight climbs. Same three sessions, same rep ranges, heavier bars. By week 8 the hip thrust and the carry should look almost unrecognisable next to your week 1 log.

THREE THINGS THAT DECIDE WHETHER IT WORKS

- **Protein** — Roughly 1.6 grams per kilo of bodyweight, every day. Training without it is building a house and forgetting the bricks.
- **Sleep** — Seven hours or the progression stalls, regardless of how well the sessions are written.
- **Steps** — 7,000–10,000 a day on top of training. It does more for body composition than any extra gym session would.

Write it down

The week only compounds if you can compare it to the next one. One page. Fill it in at the gym, not from memory on the sofa.

SESSION A	SET 1	SET 2	SET 3	SET 4	DATE:
Hip Thrust					_____
Romanian Deadlift					
Walking Lunge					
Seated Leg Curl					
Kickback / Abduction					
Dead Bug					

SESSION B	SET 1	SET 2	SET 3	SET 4	DATE:
Lat Pulldown					_____
DB Bench Press					
Seated Cable Row					
DB Shoulder Press					
Face Pull					
Hollow Hold					

SESSION C	SET 1	SET 2	SET 3	SET 4	DATE:
Back / Goblet Squat					_____
1-Arm DB Row					
Hip Thrust					
Push-up					
Farmer's Carry					
Side Plank					

Note weight x reps in each box, e.g. "40 x 8". Next week, beat one number per exercise.

So how did it feel?

If the last seven days felt different — more focused, less random, heavier than you expected — that was not the week. That was the structure.

The obvious question now is what happens in weeks 2 to 8, and how the plan keeps moving once your body catches up. That is where most people go back to guessing. You do not have to.

Peach Plan Starter

€37

The four-week glute, core and functional strength plan this week was pulled from. Full programming, progression built in, done for you. Start it the Monday after this week ends.

BEST NEXT STEP IF YOU WANT TO KEEP TRAINING ON YOUR OWN.

6-Week Kickstart Coaching

€299

Six weeks with me directly: a plan built around your body, your gym and your schedule, plus nutrition and weekly adjustments. For when you know the plan is not the only thing you have been missing.

BEST NEXT STEP IF YOU WANT EYES ON YOUR TRAINING.

Not sure which one?

Send me a DM on Instagram with the word STRENGTH and tell me what your week looked like — what felt good, what did not, what you got stuck on. I will tell you honestly which of the two fits you, or whether neither does yet.
